

# Instructions for Frozen Drink Machine

## Setup:

- Setup Frozen Drink Machine on a secure tabletop.
- Plug machine into a 120 Volt, 15 Amp circuit. Be sure electrical source is sufficient to properly power machine.
- There are three switches for the machine.
  - **MOTOR SWITCH** – turns motor on to spin the liquid.
  - **LIQUID OR ICE SWITCH** – switches to liquid or ice mode.
  - **LIGHT SWITCH**– turns on light at the top of the machine.

## Making Frozen Drinks:

- Make sure machine is assembled just like the image above.
- **CAUTION:** Make sure the bowl is clipped into place and not lose or open. If bowl is not tightly closed, and liquid is poured into bowl, the liquid will all spill out of the bowl.
- [Image 1] Turn Freezing Knob clockwise until it has reached level 3-4. The hotter it is outside the more you want to put it towards the coldest, which is at 4.
- [Image 2] Open top lid enough to pour in 1 gallon of Frozen Drink Mix.
- [Image 3] You MUST also pour in and mix 2 gallons of water with the Frozen Drink Mix.
- [Image 4] Make sure the Liquid or Ice Switch is set to Ice, and then turn Motor Switch ON.
- For night events, you can turn the Light Switch to ON.
- [Image 5] When liquid has turned icy, it is now ready to drink. Generally takes about 40-60 minutes. Gently pull on the spout to pour the frozen drink into your cup.

## Potential Problems:

- If the bowl is not securely clipped into place and liquid is poured into the bowl, then the liquid will simply spill through and go all over the ground.
- If machine has been on for several hours and it has turned the liquid to hard ICE, simply switch the mode to Liquid and allow 10-15 minutes to soften.
